

ABSTRACT OF THE DISCLOSURE

Both a user and a DPE store can obtain a benefit of a network photograph service system at the time of placing an order. A film processor for developing a film, a scanner for reading image data from the film, a database for storing the image data, a printer for printing the image data, a printing terminal, and an order terminal connected to the printing terminal via a LAN are installed in the DPE store. The user places an order for an additional print or the like by using the order terminal after receiving prints generated from the film. At this time, a DP number of a DP bag handed to the user together with the prints is used as user information. Based on the user information, the user accesses the printing terminal via the order terminal, in order to place the order.
